ABSTRACT Objective: To explore the clinical efficacy and safety of target dose of metoprolol in the treatment of patients with chronic heart failure and diabetes mellitus. **Methods:** 154 elderly patients with diabetes and chronic heart failure were randomly divided into observation group and control group with 77 cases in each group, the patients in the observation group were treated with the target dose of metoprolol and conventional therapy, while in the control group only received routine treatment. The indexes of NYHA classification, end diastolic diameter (LVESD), left ventricular end diastolic diameter (LVEDD), left ventricular ejection fraction (LVEF), 6min walking distance and the medication safety of both groups were compared before and after treatment. **Results:** Compared with before treatment, the indexes of NYHA grade, LVESD, LVEDD, LVEF, 6 minutes' walking distance of both groups were significantly improved ($P < 0.05$); Compared with patients in the control group after treatment, the above indexes improved more significantly in the observation group ($P < 0.05$). In the sixth month of follow-up, the incidence of cardiac events of the observation group was 3.90%, significantly lower than that in the control group (14.29%) ($P < 0.05$). The average fasting blood glucose, glycosylated hemoglobin of both groups showed no significant difference ($P > 0.05$). In the observation group, the blood glucose, blood lipid and liver function, renal function and other indexes showed no significant change. **Conclusion:** The target dose of metoprolol in treatment of patients with chronic heart failure and diabetes mellitus, can obviously improve the cardiac function and activity in patients with tolerance, has good clinical effect, high security and good tolerance.

观察组患者接受治疗期间水肿、房室传导阻滞、血脂、血糖、肝功能、肾功能等均未发生显著变化。观察组患者治疗后平均空腹血糖为 (6.43 ± 1.24) mmol/L, 糖化血红蛋白为 6.75%; 而对照组平均空腹血糖、糖化血红蛋白分别为 (6.52 ± 1.31) mmol/L、6.62%, 两组间不存在显著性差异 ($P > 0.05$)。观察组随访期间共 19 例患者出现 I° 房室传导阻滞, 但均未影响美托洛尔剂量的递增, 当美托洛尔每日服药量增加至 50 mg 时, 39 例患者心率减慢至 55 次/min; 当美托洛尔每日服药量增加至 100 mg 时, 29 例患者收缩压下降为 90 mmHg, 仅 4 例患者美托洛尔每日服药量达到 200 mg; 美托洛尔每日平均服药剂量为 105.33 mg。与治疗前相比, 观察组患者治疗后血压、静息心率均有一定幅度的下降, 但均未超出正常范围。

3 讨论

随着社会经济的发展, 人们生活方式的改变, 糖尿病已经成为了日常生活中的常见病, 多发病, 尤其是在老年人中, 糖尿病的发生率呈现逐年上升的趋势^[4-7]。由于糖尿病至今仍然是难以治愈的疾病, 必须依靠药物才能维持患者体内血糖水平的正常。老年糖尿病患者的用药依从性差, 血糖控制情况长期不理想。可以导致心力衰竭、糖尿病肾病、末梢神经炎、视网膜病变等并发症的发生, 严重影响患者的身体健康。其中, 心力衰竭, 简称心衰, 是因心肌收缩力降低、心输出量减少而引起的一系列的临床症状和体征, 临床常表现为乏力、呼吸困难、体液潴留、呕吐、肝区胀痛等, 5 年生存率较低^[8-10]。心衰患者治疗的近期目标为改善生活质量、缓解心衰症状, 远期目标为减少心肌重塑、防止并发症的发生、降低患者再次入院率及死亡率。血糖升高可大大增加患者心衰及其他心血管事件的发生率^[11-13]。美托洛尔可通过对交感神经系统的阻断作用给合并糖尿病的慢性心衰患者带来较好的临床收益。对于未发生心力衰竭的糖尿病患者, β -受体阻断剂对心衰的发生可起到预防性的作用^[14]。研究表明, β -受体阻断剂卡维地洛可通过心肌重构的逆转及交感神经系统过激活的抑制作用降低糖尿病亚组心肌梗死患者的死亡率^[15-17]。与低剂量美托洛尔相比, 高剂量美托洛尔可更好的改善患者的心脏功能及左心室射血分数, 且不增加心脏事件等药物不良反应, 提示该药服用用于治疗合并糖尿病的慢性心衰患者时, 应尽可能达到耐受量或最大用药剂量, 以使心功能得到更大程度的改善。

本项研究表明, 观察组患者治疗后虽有血压下降及心率减慢, 但变化幅度较小, 且均未超出正常范围, 患者耐受性较好; 观察组患者治疗前后血脂、血糖、肝功能、肾功能等均未发生显著变化, 且未出现低血压休克、水肿、高度传导阻滞等严重药物不良反应, 提示靶剂量美托洛尔治疗合并糖尿病的慢性心衰患

者安全性较高^[18-22]。在本项研究中, 美托洛尔每日平均服药剂量为 105.33 mg, 距每日 200 mg 服药量相差甚远, 分析可能与老年患者房室传导功能及窦房结功能降低有关。在初始治疗及递增用药阶段, 应严密监测患者血脂、血糖、血压、肝功能及肾功能的变化, 以提高患者用药依从性, 保证临床疗效及用药安全性。

综上所述, 靶剂量美托洛尔治疗合并糖尿病的慢性心衰患者时, 可显著改善患者的 NYHA 分级、LVESD、LVEDD、LVEF 及 6min 步行距离, 降低猝死等心脏事件的发生率, 安全性高, 耐受性良好。
