ABSTRACT Objective: To study the effects of metoprolol combined with Danhong Injection on serum growth differentiation factor-15 (GDF-15), pro N-terminal pro brain natriuretic peptide (NT Pro BNP), cell adhesion molecule-1 (ICAM-1), beta endorphin (β -EP) in elderly patients with chronic heart failure. **Methods:** Selected 328 cases of elderly patients with chronic heart failure who were treated in our hospital from October 2015 to September 2019, divided into two groups randomly. In the control group, metoprolol was taken orally, the initial dose was 6.25 mg per time, twice a day, slowly increased to 12.5 mg per time, twice a day. In the observation group, on the basis of metoprolol, Danhong injection was infused intravenously, 20 mL each time, once a day. All patients were treated for one month. **Results:** The effective rate of the observation group was significantly higher than control group ($P<0.05$). After treatment, the LVEDd, 6MWT, LVEF and LVESD of the two groups were significantly improved, and the LVEDd, 6MWT, LVEF and LVESD of the observation group were significantly better than those of the control group ($P<0.05$). After treatment, the levels of serum GDF-15, NT proBNP, ICAM-1 and β -EP in the two groups decreased significantly ($P<0.05$), the levels of GDF-15, NT proBNP, ICAM-1 and β -EP in the observation group were significantly lower than those in the control group ($P<0.05$). **Conclusion:** Metoprolol combined with Danhong injection has a significant effect on chronic heart failure in the elderly. The mechanism may be related to the decrease of serum GDF-15, NT proBNP, ICAM-1 and β -EP levels.

前言

心力衰竭是因为心肌病、心肌梗死、炎症反应和血流动力学的负荷过重等任何因素导致的心肌受损，使得心肌的功能及结构出现改变，造成心室的泵血功能或者充盈功能明显降低，主要表现为呼吸困难、体液潴留以及乏力等^[1]。慢性心力衰竭则指的是患者的心力衰竭状态持续存在。慢性心力衰竭是大部分心血管疾病患者最终的归属，也是最主要的一个死亡原因，是临床常见的综合征^[2-4]。由于老年慢性心力衰竭患者的基础病多，病因较为复杂，且对药物的耐受性较差，故病死率比较高，必须对其心功能进行调节，以达到理想的预后效果^[5-7]。目前针对该病的主要治疗原则为扩张血管，去除病因，利尿以降低心脏负荷，强心以促进心排血量的增加^[8]。常规的抗心力衰竭药物虽然能在一定程度改善预后，但致残率及病死率较高。美托洛尔能阻断交感神经的过度激活，改善心肌纤维化，减少儿茶酚胺释放，减少耗氧量，降低血压以及心率，提高左室功能^[9]。丹红注射液具有扩张冠状动脉、活血化瘀、抑制血小板聚集、改善血液流速的作用。目前尚未见将二者联用的报道。本研究创新性地将美托洛尔与丹红注射液联用，并分析其对老年慢性心力衰竭患者血清 GDF-15、NT-proBNP、ICAM-1、β-EP 水平的影响。

3 讨论

慢性心力衰竭大多由相关的心脏疾病发展而成,主要的发病群体为老年人,表现出乏力、呼吸困难等症状,病死率极高^[11,12]。该病是因受到各种因素的影响造成机体的心肌舒缩功能出现障碍,心脏的排血量降低,继而引发血流动力学障碍,心肌肥厚,心脏结构改变,心室重构,最后造成心室泵血功能降低^[5,6]。患者由于心肌收缩会出现不同严重程度的乏力,常常会产生呼吸困难以及疲惫等表现,对其躯体功能和心理健康产生了非常严重的影响^[13-16]。临幊上主要采取血管扩张剂及强心药进行治疗,虽能获得一定的疗效,但无法阻止疾病的进展,仍具有较高的死亡率^[17]。因此,需要寻找积极有效的疗法。

美托洛尔主要对患者机体中交感神经导致的血管收缩发挥抑制效果,可以降低外周循环的阻力,使心脏的后负荷明显降低,并且减慢心率,造成心肌的张力下降,从而造成患者机体的心肌耗氧量明显降低,并且血液的黏度降低,从而改善心室的舒张功能^[18-20]。丹红注射液的成分主要包括丹参酮、丹酚酸、红花等,具有活血化瘀和通脉舒络的功效。现代药理学研究发现,其能改善微循环,使冠状动脉得到扩张,抑制微血栓的进一步形成,减少血液的黏稠度,促使纤维蛋白原出现溶解,改善心肌的供血供氧,加快血流速度,预防动脉粥样硬化等^[21]。丹参的有效成分丹参酮和丹参素都能明显对抗血小板的聚集,明显减少血浆血栓素 A 含量,丹参酮 II A 能抑制低密度脂蛋白导致的血管内皮受损,有效保护血管内皮。红花能抑制血小板的聚集,增加冠脉的血流量,显著增加纤维蛋白的溶解活性,进而使血栓溶解,且抑制血栓的形成^[22]。红花的有效成分是红花黄素,其可以增加红细胞的变形性,减少血液的黏稠度,减轻血管外周的阻力,改善心肌的供血,增加冠脉的血流量,增加纤维蛋白的溶解,抑制血栓的形成^[23]。因此,本研究对老年慢性心力衰竭患者采用美托洛尔联合丹红注射液进行治疗,取得了满意的效果。

GDF-15 属于转化生长因子 - β (TGF- β)超家族的成员,具

有促进细胞凋亡、抑制细胞生长和调节炎症反应等效果^[24,25]。NT-pro BNP 作为一种心脏神经激素,主要合成于机体的心室,正常人体血中的 NT-pro BNP 水平较低,主要用于指导心衰治疗、评价心功能以及评估心衰的预后等^[26,27]。ICAM-1 能促进内皮细胞和炎症细胞之间的黏附作用,从而使炎症反应加重,还能增加内皮细胞和血小板之间的黏附作用,使血栓的风险升高,加重心肌缺血情况^[28,29]。 β -EP 可以有效评估心力衰竭患者的心肌受损程度以及血管内皮功能^[30]。本研究发现,观察组的血清 GDF-15、NT-proBNP、ICAM-1、 β -EP 水平明显低于对照组。表明丹红注射液联合美托洛尔能有效改善心力衰竭患者的血管内皮功能,从而促进心功能的改善。

综上所述,美托洛尔联合丹红注射液对老年慢性心力衰竭具有显著的疗效,其机制可能与降低血清 GDF-15、NT-proBNP、ICAM-1、 β -EP 水平有关。
